The high-magnification image on the cover, from Figure 6 in Patrizi *et al.* (in this issue, pages 755–764), shows parvalbumin (red) and glutamic acid decarboxylase 65 (green) in *Mecp2* knockout mice treated with vehicle. The authors found that ketamine improved symptoms of Rett syndrome and normalized parvalbumin-circuit inputs onto pyramidal cells in *Mecp2* knockout mice, suggesting that *N*-methyl-D-aspartate receptor antagonism may effectively treat Rett syndrome.
