This cover features single-cell RNA-seq data from 16,000+ individual neurons, glia, and endothelial cells (shown as cyan points around the edge of the circle) from mouse and human brains. After reducing the dimensionality with a deep count autoencoder (DCA) and Uniform Manifold Approximation and Projection for Dimension Reduction (UMAP), cells were arranged in a circle by their similarity. Over 5 million tracts between cells are shown, where shorter tract length represents greater similarity in molecular profiles. Hotter colors (yellow) represent a higher density of connections than cooler colors (purple). Data were mined (from PanglaoDB), analyzed, and visualized by Brian M. Schilder, a bioinformatician in the lab of Dr. Towfique Raj at the Icahn School of Medicine, New York. DCA was developed by Gökçen Eraslan and colleagues, and UMAP was developed by Leland McInnes and colleagues.

The *Journal* extends its sincere thanks to Veronica Szarejko, curator of the Art of the Brain Exhibition at The Friedman Brain Institute at the Icahn School of Medicine at Mount Sinai, for facilitating our selection of this art from the exhibit.
